

In this below are the modification needs to do in implementation

1. remove the ask your library global chat button
2. The collections grid, i want them to be vertical, like n x 2 grid
3. Remove the recently saved section from home screen that is inbox section
4. This box that says 3 reel need a category, keep it at the top
5. Remove the setting icon, that is something that we will navigate user on that section when he clicks on his profile
6. Speaking of point 5, create a profile icon on the home screen, round shape, user photo in that
7. Rename the inbox in the footer. (footer will have only 2 thing library and inbox)

First screen user sees after login, but in the todo or backlog add that we also want screen for notification permission + share sheet permission demo

Inspo for how the chat should look

Ask anything about fashion...

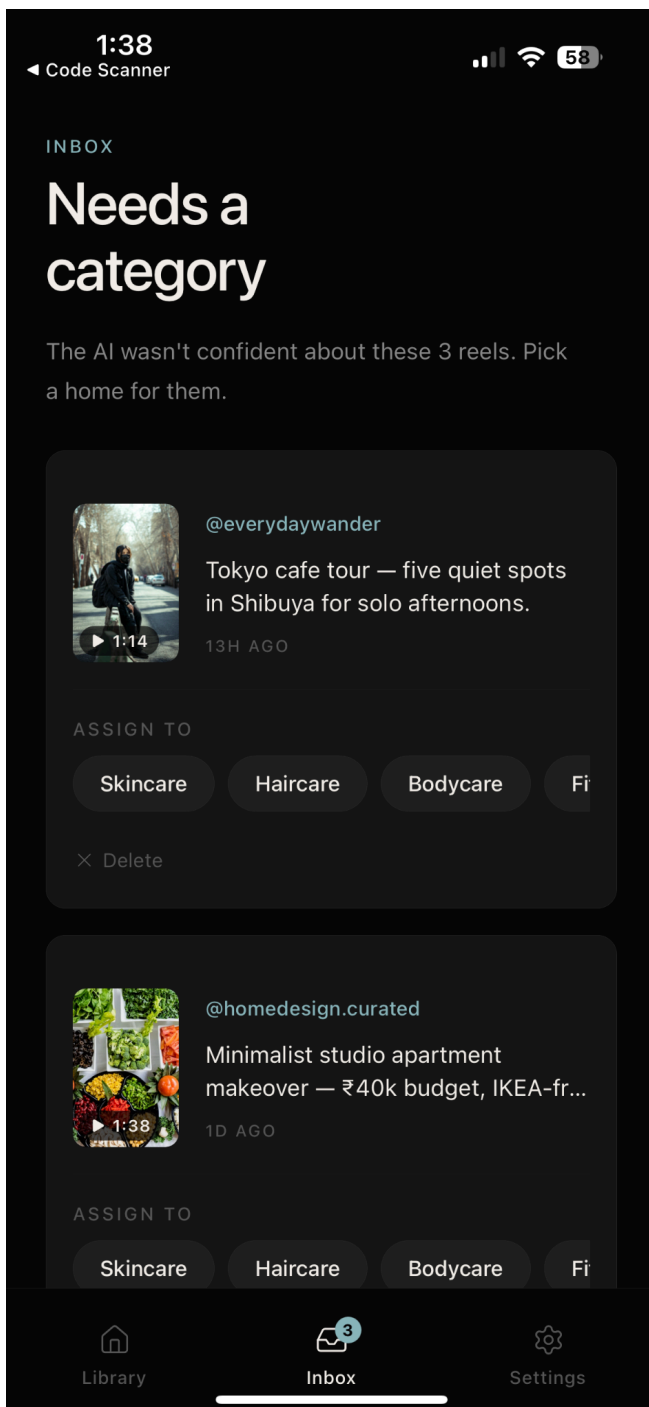

Settings/screen opens when user clicks on his profile on main home screen

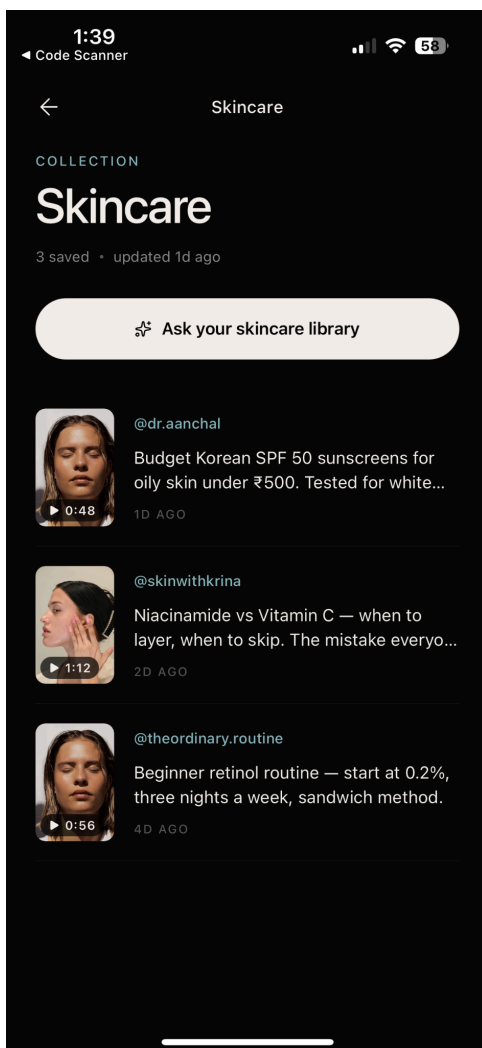

Things need to modify here Settings/screen opens when user clicks on his profile on main home screen

Things need to modify here or keep dummy here (make sure anything that is dummy we need to add that in to do /backlog)

1. Auto categorize toggle behaviour, share sheet permission section we will manage later for now only create screen
2. Save notification should be workable
3. Remove preview save notification button/section
4. Privacy section create the ui, later we will add the contract there or something that tells user that his data is protected
5. Keep the signout button in the top card where user name and email is, keepit above or below edit or may be horizontal other eend of settings text. Choose any one of these which looks good

This is the inbox section, i like the card layout, just fix the delete button i want a red dustbin icon instead of cross delete text and that icon should be on the other end of creator name
 Apart from it, what ever you can show from the db , like whatever we are saving or can save show everything on the related reel card. Also we need to figure out what happens when a user click on any reel on card, ideally i want that reel to open in insta or if insta is not installed then in chrome web. Like how typical flow works

This is the ui, when user clicks on any category card, so everything is good in this few changes are

1. Ask you skincare library should be a single icon on the right footer place, it should stick like when user scroll it should remain there only
2. The reel card again , same thing show everything that is available in our db, and instead of xD ago show the saved date or may be from it we can calculate the x D ago valuee so kep it as it is
